

THERMA-KLEEN®

TECH SHEET

Detail/Blast Tool

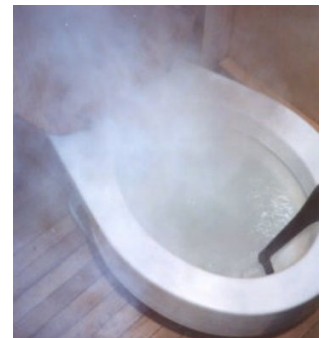

Use – to clean small areas that are difficult or impossible to clean using any other method. You will be able to clean areas which are too small to clean with a tooth brush. Using a Therma-Kleen detail or Blast Nozzle you can simply push dirt away from the tightest spaces, no more using toothbrushes to get into the nooks and crannies. Simply direct the steam and push away the dirt. The steam also penetrates deep into porous surfaces cleaning deeper than traditional

cleaning, removing odor causing mold and mildew all the while reviving colors to a much higher standard. Example – Faucets, Fixtures, Dishwasher Edges, Bathroom Floor Corners, Stains in Carpets, Car Interiors, tight corners on tires and motor compartments, spot degreasing of industrial equipment, deodorize, defrosting, etc.

The detail tool should almost always be used with the detail brush attached to the end of the detail tool. Exceptions to this are the cleaning of condensers, radiators, artificial plants (removing dust from Real Plants can be done by keeping the nozzle at a distance of 18" or more inches from the plant and spraying with a cool vapor).

Operate this tool at ¼ volume. For best results first pass over the surface with a low setting, heating it. Make a second pass, after the surface is heated and dirt & debris will be completely removed. Once clean wipe the surface with a dry absorbent cloth.

Clean hard to reach areas and corners first, then proceed with the appropriate larger brush.
